

Unsubmitted Internal Memo - A-Series Vault Drift

To: RMI Systems Oversight [Not Sent]

From: A. Reynolds (AR99152)

Subject: Vault Drift Observations - A-Series

The behavioral offset in A-07 and A-12 continues to widen.

After reinstatement, subjects are increasingly misattributing their own emotional responses to non-participatory vault content. A-12 recalled a sibling interaction that was never recorded in baseline intake. A-07 wept during a simulation loop that contained no emotionally weighted material.

We originally speculated mild index shuffling, but the anomalies persist even after trace recalibration. There is no obvious causal link. If drift occurred this early in the indexing protocol, the entire A-series output may be functionally compromised.

As I've stated in two previous reviews, I urge the committee to freeze all active reinstatement in the B-series until we fully understand the integration gaps from the A-phase data structure. We cannot build stability on a fractured index.

[This memo was never submitted.]
